

Agency OS — Product Requirements Document

Prepared by: Levi Eweka **For:** Sandesh Shrestha (Lead Developer) **Project Name:** Agency OS
Date: March 2026

Overview

We are building a centralised internal dashboard — the Agency OS — that replaces the need to jump between Asana, separate CRM tools, and other platforms. Everything the agency needs to operate day to day lives in one place. The product has two sides: an internal team view and a client-facing view. The goal is to give me, as the founder, full visibility of the business from a single screen, give the team a clean place to manage their work, and give clients a professional portal to see what is happening with their project.

The Problem We Are Solving

Right now we are using Asana for task management but I personally do not use it. We are tracking new deals separately, tracking existing clients separately, and the team is moving between too many tools. Nothing is connected. The Agency OS solves this by being the single source of truth for tasks, deals, clients, finance, and performance — all in one dashboard.

User Roles

There are three types of users, each with their own dashboard view.

Founder (Levi) — Full access to everything. Can see all tasks across all team members, all deals in the pipeline, all client accounts, revenue tracking, and team performance.

Team Member — Can see tasks assigned to them, the projects they are working on, time tracking on their tasks, and internal messaging. They can also see the agency revenue goal progress so there is transparency around how the business is doing.

Client — Has a login and can only see their own project. They see their task board, their analytics, and their monthly AI-generated report. They cannot see anything related to other clients or internal agency operations.

Core Modules

1. Task Management

This replaces Asana. Tasks should be organised in a Kanban-style board where cards can be dragged and dropped between columns. Standard columns would be something like To Do, In Progress, In Review, and Done — but these should be configurable. Each task card should show the task title, the client or project it belongs to, who it is assigned to, a due date, and a status. Tasks should also have a time tracking feature built in so team members can log how much time they have spent on a given task. This does not need to be complex — a simple start/stop timer or manual time entry on the task card is fine.

2. New Client Pipeline (CRM — Deals)

This replaces whatever I am currently using to track prospects. It should be a Kanban board for deals, with columns representing different stages of the sales process — for example Lead, Proposal Sent, Negotiation, Closed Won, Closed Lost. Each deal card should show the prospect name, the services they are interested in, the deal value, and the next action required. Cards should be draggable between columns. This is my primary view for knowing where each new business opportunity is at.

3. Existing Client Pipeline

This is separate from the deals board. Once a client is active, they live here. This view should show all active clients, what services they are on, their renewal dates, their monthly recurring revenue value, and any open tasks or flags on their account. The goal is to give me a quick overview of the health of every existing client relationship at a glance.

4. Finance and Revenue Tracking

A simple revenue dashboard showing our total monthly recurring revenue, one-off project income, and progress toward a monthly revenue target. The target should be configurable. The display should be visual — something like a progress bar or gauge showing where we are against the monthly goal — so the team can see it and understand the context of the work they are doing. This does not need to connect to any accounting software at this stage. It can be manual input or pulled from the client records in the system.

5. Internal Messaging

Basic internal chat to reduce reliance on Slack for anything work related. This does not need to be complex. It should support direct messages between team members and ideally project or client-specific channels so conversations are kept in context. We are not trying to rebuild Slack — just have enough messaging functionality built in so that team members do not need to leave the platform for internal communication.

6. Client Portal

Each client gets their own login. When they log in they see three things only.

First, their project task board — a Kanban view of their own tasks showing what has been done, what is in progress, and what is coming up. They cannot edit tasks, only view them.

Second, a performance analytics overview. This should connect to or pull data from Google Analytics, Google Ads, Facebook Ads, and Google Business Profile. It should display the key metrics for each channel in a clean overview format — traffic, ad performance, and local search visibility. The integrations should be set up per client so each client only sees their own data.

Third, a monthly AI-generated report. At the end of each month an AI summary is generated based on that client's task activity and their analytics data. It should summarise what was done that month, how the key metrics moved, and what the plan is for the following month. This report should also be emailable directly to the client so they receive it in their inbox as well as being able to view it in the portal.

Claude Skills Reference Section

Within the internal team view, there should be a section that acts as a reference library for the Claude automation skills being built for the agency. This does not need to be complex — essentially a page or section where skills can be documented with a title, description, and notes on how to use them. Think of it as an internal knowledge base for the AI tooling we are building.

What We Are Not Building

We are not replacing Gmail. Email stays as is. We are not building a complex accounting or invoicing system at this stage. We are not rebuilding Slack from scratch — just enough internal messaging to reduce context switching. We are also not trying to build something overly complicated. The simpler it is to use, the more the team will actually use it.

Technical Notes from the Discovery Call

Sandesh has confirmed the approach. The plan is to build from scratch. Slack and Notion will be eliminated by this product. Gmail stays. The Kanban-style drag and drop for both tasks and deals was confirmed as the right approach. Sandesh has been shared the existing codebase which has some early UI references, though it is not wired up. A more formal walkthrough will follow via Slack.

Summary of Why We Are Building This

The agency is moving from doing one-off website projects to selling ongoing retainers — SEO, Google Ads, paid social, email marketing, and Google Maps optimisation. To do that well we need our operations to be tight. At the moment too much time is spent moving between tools and too much information lives in different places. The Agency OS gives us the infrastructure to operate professionally, retain clients, and scale the recurring revenue side of the business. It also gives clients a reason to stay — they have a portal, they have visibility, and they receive a professional monthly report. That level of service is what turns a one-off client into a long-term retainer.
